## **Introduction**

In our last session, we looked at the two main competing theories claiming to explain where the physical matter of Earth and our universe came from: Special Creation and the Big Bang. Today we will be examining the Origin of Life. In the Biblical Special Creation model, we will look at the origin of plants, aquatic animals and flying creatures. In the Atheistic Natural Evolution model we will restrict our examination to their next huge hurdle: the origin of the first living cell.

## **Special Creation**

The Bible teaches that physical life began with the direct creation of the basic kinds of plants.

## **Creation of Plants**

And God said, “Let there spring forth on the earth grass, the plant yielding seed after its kind, and the fruit tree making fruit after its kind, in which is its seed, upon the earth.” And it was so. And the earth brought forth grass, the plant yielding seed after its kind, and the tree yielding fruit in which is its seed after its kind, and God saw that it was good.

And there was evening and there was morning: Third day. Genesis 1:11 to 13

The creation of all the kinds of plants occurred on the Third Day. Kinds in the Biblical account needs to be made clear: A kind is a type of plant or animal which is distinct from other kinds, and the original created creatures contained complex genetics which would

allow the kind to diversify into various families and species which can adapt to local conditions and environments. An example of a kind from the plant kingdom is the pea kind, which was able to diversify into field peas, garden peas, telegraph peas, snow peas and sugar snap peas. Evidence that these are derived from the same kind is the fact that they can interbreed and produce offspring which are usually fertile.

As the Bible claims that these original plants were created directly by God, we would also expect them to immediately have perfect genetics and be perfectly designed for their role in the completed biosphere. This is the opposite to the evolutionary model, in which the organisms are slowly shaped by mutations and natural selection until they become well enough adapted to survive in their niche.

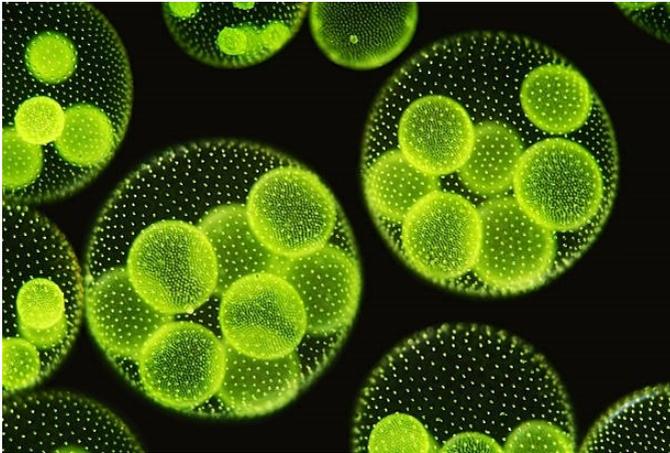

As each kind is separately created, we would expect that there will usually be distinct differences, or gaps, between kinds. But as they are all made by the same Creator, we would also often expect that similar DNA, mechanisms and structures are used in the different kinds to perform similar functions. Often, very different organisms will exhibit some of these almost identical structures. These gaps and similarities indicate a common designer. In contrast, common descent, as taught in evolution, should only show smooth transitions, not the distinct gaps and unexpected similarities that are observed between kinds.

Note that these plants must have grown and matured rapidly and in significant numbers throughout the world as part of the preparation for the creation of animals, which was to happen only one day later. Some of these kinds are also created as complex vascular plants complete with the ability to flower and yield fruit and seeds.

Though not mentioned, it is reasonable to assume that at this time all photosynthesizers are meant, including cyanobacteria, algae and the

aquatic plants that were also created as the food source for the aquatic animals which were soon to be created. Likewise for the microbes and fungus that both live symbiotically with the plants and also break down dead plant material so it can be recycled.

Figures 1 to 5 show us some of these plants, essentially in order of increasing complexity. The basis for this increasing complexity will be looked at in more detail in Session 3, where it is revealed as another major problem for evolution.

**Figure 1:** Algae, magnified view of a 'simple' unicellular plant.

**Figure 2:** Red, Brown and Green Multicellular Seaweeds

**Figure 3:** Wild Barley Grass (Israel)

**Figure 4:** Flowering Plants, Christchurch NZ

**Figure 5:** Tall Vascular Plants (Apple Trees, Mornington Peninsula)

Finally, note that the Bible does not describe plants as breathing organisms having souls and spirits. They are extremely complex self-reproducing machines designed to provide oxygen, food and shelter for the animals and humans. As they do not have souls, they cannot die in a Biblical sense.

The Bible shows that there is then a day's delay from new creation on the Earth while the Sun, Moon and stars are being created, which we looked at in our last session. I believe that the plants were also growing very rapidly during that day, so there would be food available when the animals were created.

### **Creation of Aquatic Animals and Flying Creatures**

Then God said, "Let the waters swarm with swarms of live souls, and let flying creatures fly above the earth across the face of the expanse of the heavens." God created great sea dragons and every living soul that moves, which the waters swarmed with, according to their kind, and every winged flying creature according to its kind. And God saw that it was good.

And God blessed them, saying, "Be fruitful and become many, and fill the waters in the seas, and let the flying creatures multiply on the earth."

And there was evening and there was morning: Fifth day. Genesis 1:20 to 23

Now God moves into filling the earth with living souls. Note carefully that the Hebrew word for soul in vs 20 and 21 is נֶפֶשׁ *nephesh*. Most translations incorrectly substitute creature for soul. Nephesh means soul and it is precisely the same word the Bible uses to describe human souls.

Also, pause and think carefully about vs 22: God blesses and speaks directly to these animals, telling them to fill the earth. God did not bless the plants, nor speak to them. There can be no doubt that God has a relationship with these animals and communicates with them.

### **Aquatic Animals Created**

God tells us that He created all the many kinds of aquatic animals during this single day, and though not enough to completely fill the rivers, lakes and oceans, there was enough for them to make the waters swarm. The aquatic creatures included water bugs, corals, shellfish, trilobites, fish, dolphins, whales and even sea dragons, as a brief sampling. In this context, it is worth remembering that there were many kinds created at this time that no longer live today. We live in a world of extinctions, where not only species but entire kinds of creatures have died out and are still dying out. This is not a world where new kinds are appearing, only minor variations of existing kinds. We will see why this is so in later sessions. Figures 6 to 12 illustrate a few of these creatures.

**Figure 6:** Coral and Fish (Great Barrier Reef, off Mackay)

**Figure 9:** Leafy Sea Dragon (Victorian Coast, Aus)

Figure 10: A Better Candidate for Sea Dragon?

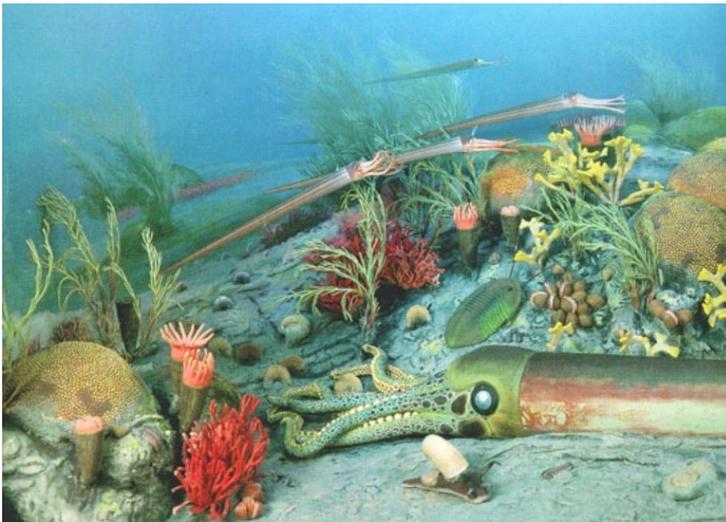

Figure 11: Some Extinct “Devonian” Sea Creatures

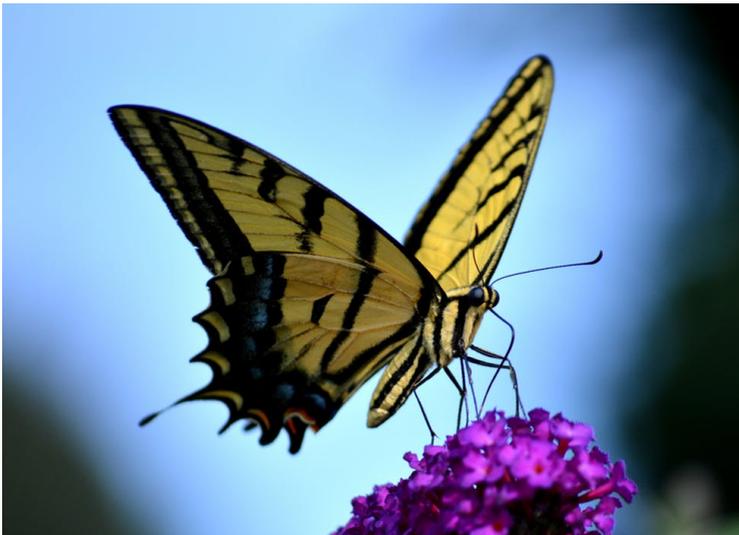

**Figure 12:** And More Extinct “Devonian” Sea Creatures

### **Flying Creatures Created**

But God was not done yet. On this day he also created all of the flying creatures, including flying insects, butterflies, birds, bats, flying foxes and pterosaurs. Most of these flying creatures have very active metabolisms, such as hummingbirds, which can die after only four hours without food. This is why I believe that many plants were already flowering and some were producing fruit and seeds by Day Five of Creation Week. Figures 13 to 19 illustrate a few of these magnificent flying creatures.

**Figure 19:** Some of the many Pterosaurs, now Extinct

The main criticisms of the Biblical Creation Account are the clearly miraculous nature of the entire account and its short time line. However, the miraculous nature of the account is constrained by the numerous details given in Genesis, which specify what the miracles are and the order and timing they were performed in. And it is all underlain by the Bible's claim that Jehovah God is a self-existing being who is easily capable of doing such miracles. The only real issue here is acceptance that this God exists.

The short time line is another aspect of the miraculous nature of God's Creation. If these creatures were formed miraculously, as the Bible claims, there is no reason why it had to take much time. The time problem is really an issue for evolution, where even their claimed billions of years is far, far too little time for any of their

supposedly non-miraculous and random transformations of nothing into complex life to have occurred.

But by now the Special Creation account is a long way ahead of Evolution's Origin of Life story. Let us look at how they get to a point where they have just one 'simple' living cell capable of reproducing itself.

## **Evolutionary Explanations and Issues**

### **Origin of the First Cell**

Evolutionist usually claim that all life on earth is descended from one cell. But how could a living cell arise from non-living chemicals?

This is a topic mostly avoided by evolutionists, including Darwin. But without their first cell, they can not evolve any other life. It is avoided because they cannot explain how a first cell could arise by random processes. And the more we learn about the complexity of even a 'simple' cell, the worse their situation becomes. And they are also under increasing time pressure, as they once thought they had one to two billion years to form the first cell. Now that supposed 'gap' is less than three hundred million years, and it keeps shrinking. So they need to have a far more complex first cell arise in much less time, making the process increasingly impossible.

### **Biogenesis**

The evolutionists' problems intensified when Louis Pasteur, in 1864, demonstrated scientifically that spontaneous generation of life does not occur, which is what evolution is actually claiming. Pasteur's

work led to effective sterilisation procedures and to the Law of Biogenesis, which states that **All life is from life.**

And why do the evolutionists persist with their unscientific claims? This quote from Professor Richard Lewontin explains it well:

‘Our willingness to accept scientific claims that are against common sense is the key to an understanding of the real struggle between science and the supernatural. We take the side of science in spite of the patent absurdity of some of its constructs, in spite of its failure to fulfill many of its extravagant promises of health and life, in spite of the tolerance of the scientific community for unsubstantiated just-so stories, because we have a prior commitment, a commitment to materialism.

It is not that the methods and institutions of science somehow compel us to accept a material explanation of the phenomenal world, but, on the contrary, that we are forced by our *a priori* adherence to material causes to create an apparatus of investigation and a set of concepts that produce material explanations, no matter how counter-intuitive, no matter how mystifying to the uninitiated. Moreover, that materialism is absolute, for we cannot allow a Divine Foot in the door.’

(Richard Lewontin, *Billions and Billions of Demons*, The New York Review, p. 31, 9 January 1997)

The struggle about the origin of life is really about rejecting or believing in Jehovah God, not science. Lewontin’s quote makes this clear, for he is openly admitting that they believe in evolution because they refuse to believe in God, even though they know that science exposes their beliefs as absurd (the short version of *counter-intuitive* and *mystifying*).

**Chemical Evolution, Also Known As Abiogenesis**

Evolution can't happen until we have a living cell capable of reproducing itself. So although some evolutionists call the origin of the first cell Chemical Evolution, it is more correctly called Abiogenesis: the origin of life from non-life. Until the first cell is able to self-replicate, there is nothing for natural selection to select between. So, how could that first cell arise by natural means?

This article from New Scientist, dated 14 October 2009 gives the current suggested route:

**How Life Evolved: 10 Steps to the First Cells**

By Nick Lane and Michael Le Page

We may never be able to prove beyond any doubt how life first evolved. But of the many explanations proposed, one stands out—the idea that life evolved in hydrothermal vents deep under the sea. Not in the superhot black smokers, but more placid affairs known as alkaline hydrothermal vents.

This theory can explain life's strangest feature, and there is growing evidence to support it.

Earlier this year, for instance, lab experiments confirmed that conditions in some of the numerous pores within the vents can lead to high concentrations of large molecules. This makes the vents an ideal setting for the "RNA world" widely thought to have preceded the first cells.

If life did evolve in alkaline hydrothermal vents, it

might have happened something like this:

1. Water percolated down into newly formed rock under the seafloor, where it reacted with minerals such as olivine, producing a warm alkaline fluid rich in hydrogen, sulphides and other chemicals—a process called serpentinisation. This hot fluid welled up at alkaline hydrothermal vents like those at the Lost City, a vent system discovered near the Mid-Atlantic Ridge in 2000.

2. Unlike today's seas, the early ocean was acidic and rich in dissolved iron. When upwelling hydrothermal fluids reacted with this primordial seawater, they produced carbonate rocks riddled with tiny pores and a “foam” of iron-sulphur bubbles.

3. Inside the iron-sulphur bubbles, hydrogen reacted with carbon dioxide, forming simple organic molecules such as methane, formate and acetate. Some of these reactions were catalysed by the iron-sulphur minerals. Similar iron-sulphur catalysts are still found at the heart of many proteins today.

4. The electrochemical gradient between the alkaline vent fluid and the acidic seawater leads to the spontaneous formation of acetyl phosphate and pyrophosphate, which act just like adenosine triphosphate or ATP, the chemical that powers living cells.

These molecules drove the formation of amino acids—the building blocks of proteins—and nucleotides, the building blocks for RNA and DNA.

5. Thermal currents and diffusion within the vent pores

concentrated larger molecules like nucleotides, driving the formation of RNA and DNA—and providing an ideal setting for their evolution into the world of DNA and proteins. Evolution got under way, with sets of molecules capable of producing more of themselves starting to dominate.

6. Fatty molecules coated the iron-sulphur froth and spontaneously formed cell-like bubbles. Some of these bubbles would have enclosed self-replicating sets of molecules—the first organic cells. The earliest protocells may have been elusive entities, though, often dissolving and reforming as they circulated within the vents.

7. The evolution of an enzyme called pyrophosphatase, which catalyses the production of pyrophosphate, allowed the protocells to extract more energy from the gradient between the alkaline vent fluid and the acidic ocean. This ancient enzyme is still found in many bacteria and archaea, the first two branches on the tree of life.

8. Some protocells started using ATP as well as acetyl phosphate and pyrophosphate. The production of ATP using energy from the electrochemical gradient is perfected with the evolution of the enzyme ATP synthase, found within all life today.

9. Protocells further from the main vent axis, where the natural electrochemical gradient is weaker, started to generate their own gradient by pumping protons across their membranes, using the energy released when carbon dioxide reacts with hydrogen. This reaction yields only a small amount of energy, not enough to make ATP. By

repeating the reaction and storing the energy in the form of an electrochemical gradient, however, protocells “saved up” enough energy for ATP production.

10. Once protocells could generate their own electrochemical gradient, they were no longer tied to the vents. Cells left the vents on two separate occasions, with one exodus giving rise to bacteria and the other to archaea.

This is a creative story, and more interesting than their earlier versions. But it is absurdly simplistic and contravenes almost every known law of biochemistry. And it is almost devoid of details. One of the most critical details is how many atoms must—all at the exact same time—every one of them—be the atom of the right element in the right location and with the right chemical bonds to its surrounding atoms to enable a cell to become functional? The answer is approximately 5 billion atoms. How likely is that? A snowflake would have a far better chance of surviving in the Lake of Fire!

Let us compare their speculations with what is actually necessary to have even the simplest living cell:

The simplest natural organism may be *Mycoplasma pneumoniae*, a bacteria that can cause walking pneumonia in people. It has just 525 genes. In comparison the bacterium *E. coli*, a widely studied organism, has 4,288 genes. Humans have roughly 20,000 genes. (<https://www.quora.com/What-is-the-simplest-life-form>).

Figures 20 to 22 give us a glimpse into its complexity.

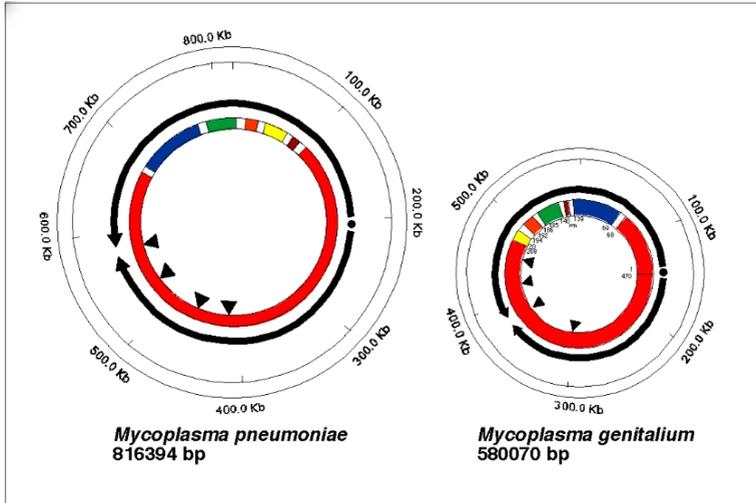

Figure 20: Summary of the Genomes of Two Mycoplasmas

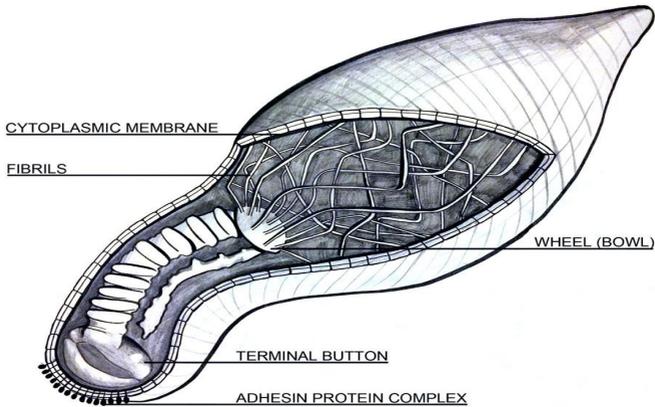

Figure 21: Structure of *Mycoplasma Pneumoniae*

speculations, even when they can clearly see that it is impossible. Let us explore how complex their first simple cell really must be.

### Synthetic Life?

But first an interesting sidetrack. Is it perhaps actually simple to create a living cell? Have Venter and his scientists already created synthetic life as the above report and this US ABC video claim?

<https://www.youtube.com/watch?v=aRzrYNVXF28> ABC news 3 min.

Let's get some more detail on what they actually did:

<https://www.youtube.com/watch?v=MIAIOZIkM2M> Sci Show 5 min.

So, in summary, the US ABC report that they “created life” with “just four bottles of chemicals” is blatantly dishonest. Their ‘synthetic life’ was built by copying the DNA code from a ‘simple’ microbe and then reconstructing it, using extremely complex DNA splicing technology plus help from living bacteria and yeast. They then removed the DNA from a living microbe of the same type and inserted their reconstructed DNA into it. Their new copy of the organism’s DNA was sufficiently accurate for the cell to survive and even replicate. Though it was an incredible achievement, this process does not even begin to address the question of how a first cell could arise. Nor is theirs a realistic simplest cell, as it can only survive in a protected and pampered lab environment.

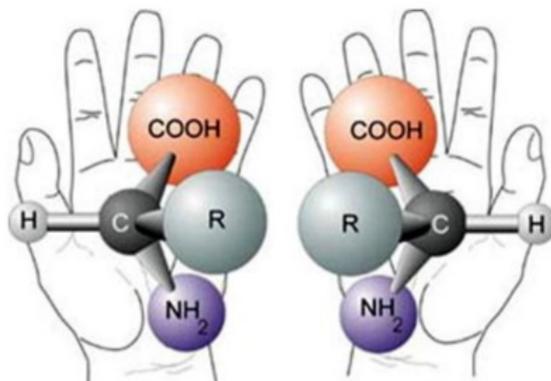

Note that even the more complex *Mycoplasma pneumoniae* shown earlier cannot reproduce on its own. It is a parasite that needs to be embedded in a mammal, usually its lungs, before it can get enough nutrients to multiply. So even it is an inadequate first cell.

### Basic Biochemicals

So, how could Abiogenesis really happen?

Stanley Miller and Harold Urey's 1953 experiment, in which they made 5 amino acids, was also once claimed as the beginning of creating life from non-living chemicals. But time has proven many of their experimental conditions were unrealistic and their amino acids were a racemic mix of left and right handed amino acids. But living organisms only function with purely left-handed amino acids. Right handed amino acids would corrupt any proteins they went into and would soon kill the organism (Figure 23). Miller's experiment also produced many other compounds, and most of them were highly toxic to life.

Though later experiments by Miller and others produced other amino acids, including some containing sulfur, they came to realise that a few amino acids are nowhere close to explaining the origin of life. It is like making a simple, sort-of round, iron ball that might fit into a bearing and then claiming you are now able to make an Airbus A380.

The chirality of typical amino acids. 'R' represents the carbon-hydrogen side-chain of the amino acid, which varies in length. R=CH<sub>3</sub> makes alanine, for example.

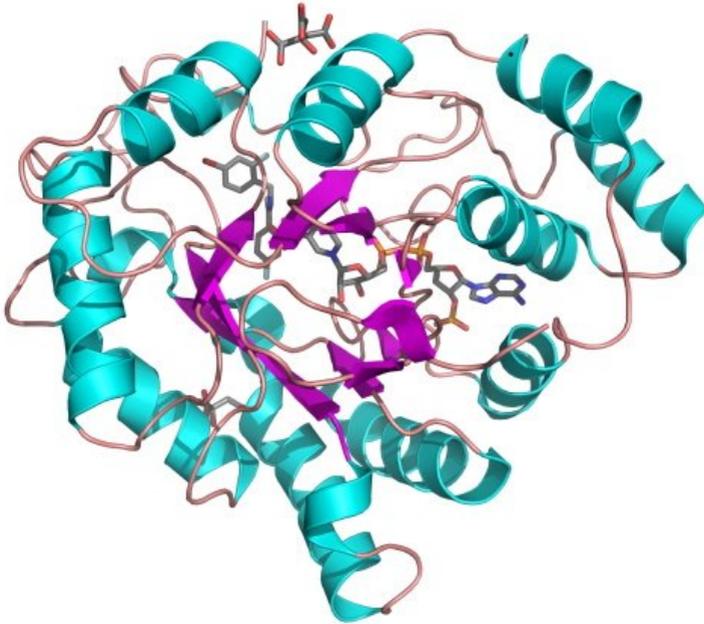

**Figure 23:** Left and Right Handed Amino Acids. A perfect mixture of the two, which always happens when they are made in a lab, is called a racemic mixture.

Just as living organisms require left-handed amino acids to make proteins, we also require exclusively right-handed sugars to fuel life and make the sugar backbones of DNA and RNA. Even a single left-handed sugar in a DNA molecule would put a kink in its precise double helix, stopping its nanomachines from reading and repairing the DNA. And again, disability would soon result and likely even death. Are you seeing a comparison here to the Big Bang's problems with matter and antimatter? They can not explain how either of these exclusive requirements for life arose.

### Complex Biopolymers

Basic biomolecules do not spontaneously grow into more complex biopolymers like proteins, carbohydrates and DNA (Figure 24). Instead, biopolymers spontaneously decompose to simpler molecules

and gases, as we know from observing any living organism that has died. And millions—even billions—of years would not alter or improve this situation. Contrary to evolutionists' claims, time is not the hero of the plot.

**Figure 24:** Aldo-keto Reductase: Example of a complex biopolymer enzyme made from amino acids. Wikipedia

Even if you could discover some natural way to force amino acids to form a protein chain, how difficult is it for random events to create a functional protein enzyme? Doug Axe investigated this experimentally, and published his results in *Estimating the prevalence of protein sequences adopting functional enzyme folds*, J Mol Biol. 2004 Aug 27;341(5):1295-315. ([https://www.researchgate.net/publication/8389796\\_Estimating\\_the](https://www.researchgate.net/publication/8389796_Estimating_the)

produce RNA templates from it. Living cells require other nanomachines to read the codes on the RNA and assemble an amino acid chain (protein) from it. Other nanomachines are required to fold the new protein into a functional form. Yet other nanomachines are used to transport the new protein to where it is needed. Portals and pumps in cell walls are needed to capture and transport food into the cell. Enzymes are needed to digest incoming food and others to capture and remove waste products through different specialised ports in cell walls. Factories are needed to break down excess and worn-out enzymes into amino acids ready for reuse.

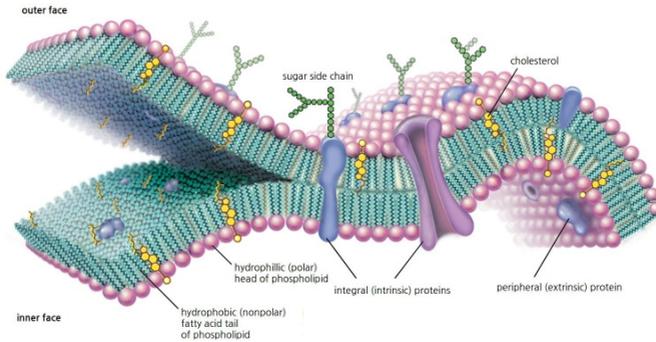

DNA code, which was once called “Junk’ by evolutionists before they learned what it did, is needed to produce other RNA molecules to fine tune production and silencing of various gene products. DNA even needs its own repair nanomachines. DNA contains the instructions to make all of these biomachines, but also requires them already made to be able to function. This is an extreme version of the chicken and egg problem, as both the chicken and the egg must arise simultaneously.

Let’s look at some of these essential cell components:

### **Cell Walls and Membranes**

As the video and Figure 25 below show, these ‘basic’ items are far more complex and essential to life than many people think.

<https://www.youtube.com/watch?v=GalPFs52cUU> (6 min)

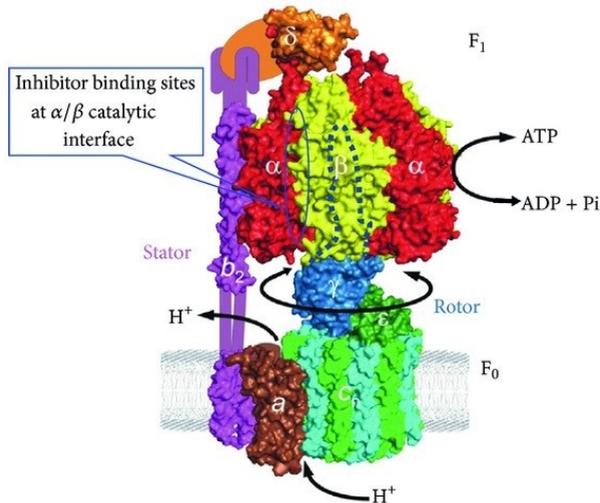

**Figure 25:** Cell Membrane, showing some of the common embedded functional structures necessary for life.

### Mitochondria and ATP Motor

This amazing high-speed ATP motor is required in every living cell to convert food into usable energy. Mitochondria enhance their effectiveness. See Figure 26 and this video:

[https://www.youtube.com/watch?v=b\\_cp8MsnZFA](https://www.youtube.com/watch?v=b_cp8MsnZFA) (4 min)

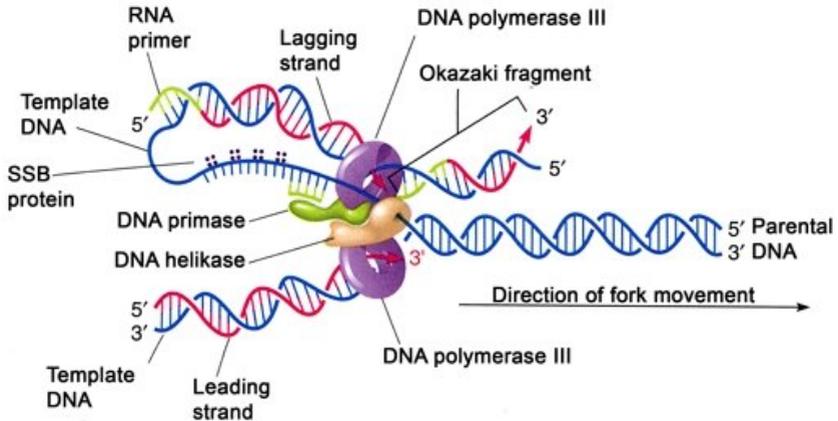

**Figure 26:** ATP Synthase is a rotary electric motor driven by hydrogen ions that converts ADP into ATP, the molecule that fuels virtually everything in the cells of all living things. It is a masterpiece of molecular nanotechnology design.

## DNA Replication

DNA is essential to all living cells, as it contains the precisely coded instructions necessary to maintain the cell and to enable it to reproduce itself, including these DNA instructions. But copying the double-stranded DNA is a very complex procedure, as indicated in this video of prokaryote DNA replication and Figure 27:

<https://www.youtube.com/watch?v=qdxVOQverE4> (5 min)

**Figure 27:** Overview of the major nanomachines required for DNA Replication. No cell could reproduce until every one of these complex protein machines were designed, manufactured and correctly located on the DNA so it can be copied.

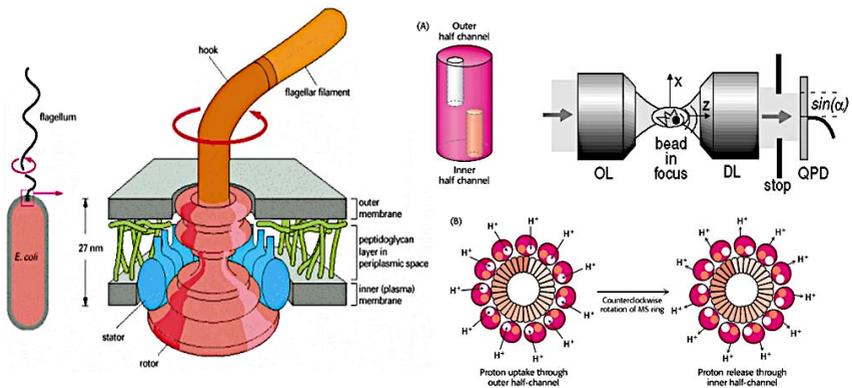

### Bacterial Flagellum and Irreducible Complexity

This video explains how irreducible complexity means that the exquisite nanomachines in our cells cannot have arisen tiny step by tiny step, as the machines are useless until they are complete. A simple comparison would be how a car is useless for its intended function if it does not have a gearbox, even if all the other parts are there. Figure 28 illustrates the bacterial flagellum as an example of this. The flagellum is a high-speed, reversible inboard electric motor and propeller built at the molecular level and present in many bacteria, where they use it to help them find food and avoid danger. The DNA instructions even specify how many of each part to make, the order to make them in and how to assemble them.—There is nothing simple about it.

<https://www.youtube.com/watch?v=NaVoGfSSSV8> (15 min)

## Direct observation of steps in rotation of the bacterial flagellar motor

Yoshiyuki Sowa, Alexander Rowe, Mark C. Leake, Toshiharu Yakushi, Michio Homma, Akihiko Ishijima & Richard M. Berry

**Figure 28:** Simplified Illustration of an *E. Coli* Flagellum embedded in the cell membrane.

### Eukaryotic DNA Replication and Transcription

Plus their protein production, centromeres and cell division process. The protein production process is essentially the same in ‘simple’ prokaryotes, but the centromeres are a more complex system that is required in the DNA of eukaryotes, as shown in this video:

<https://www.youtube.com/watch?v=fpHaxzroYxg> (20 min)

Most of these things are required just for a ‘simple’ single cell organism. The underlying issue here is information. Where has all the precisely coded information on the DNA molecules required to make all of these complex machines come from? There is no known physical process that can randomly produce complex, coherent information. And I have presented only a small sampling of what is going on inside these cells. What do the more honest evolutionist origin of life researchers say about this?

### **The Wheel and Magnet**

The famous British evolutionist J.B.S. Haldane stated in 1949 that evolution could never produce ‘various mechanisms, such as the wheel and magnet, which would be useless till fairly perfect.’ Therefore such machines in organisms would, in his opinion, prove evolution false. We have learned a great deal since then. The wheel-like molecular motors seen above (ATP synthase and flagellum) have more than fulfilled one of Haldane’s criteria. Also, turtles and monarch butterflies use magnetic sensors for navigation that fulfil Haldane’s other criterion. So on both counts, evolution has been proven false. The more we know about the complexity of living organisms, the more absurd belief in the undirected evolution of life becomes.

“The biggest gap in evolutionary theory remains the origin of life itself... the gap between such a collection of molecules [amino acids and RNA] and even the most primitive cell remains enormous.”—Chris Wills, professor of biology at the University of California, USA.

“Anyone who tells you that he or she knows how life started on earth some 3.4 billion years ago is a fool or a

knave. Nobody knows.”—Professor Stuart Kauffman, origin of life researcher, University of Calgary, Canada.

The impossibility of life originating here has led to some evolutionists suggesting that life on earth was seeded here by extraterrestrials. But all that idea does is alter the location where something impossible must happen. And then it adds the additional improbability of extraterrestrials being able to come here at the right time to seed life. It is far easier to believe in God’s ability to start life on earth than an extraterrestrial’s, and SETI has clearly demonstrated there is no evidence that extraterrestrials exist.

As Sir Fred Hoyle stated it:

“The likelihood of the formation of life from inanimate matter is one to a number with 40,000 naughts after it ... It is big enough to bury Darwin and the whole theory of evolution. There was no primeval soup, neither on this planet nor any other, and if the beginnings of life were not random, they must therefore have been the product of purposeful intelligence.”

## **Conclusion**

Abiogenesis, the origin of life due to random chemical reactions, is utterly impossible.

As there is life on Earth, the only viable alternative is that it must have been deliberately created. The Bible contains an account of such a Creation of Life, done by a God who had the intelligence and skills required to design and produce living organisms. The Bible also says that the remarkable being who made these organisms is Eternal, and wants to give us everlasting life.

## Next Session

Special Creation: God creates land animals and the First Humans.

Evolution: Progressing from a single cell to complex organisms.

Plus: How complex is an organism like a human?

## Appendix

### Stanley Miller and Harold Urey's Amino Acids

This experiment is still in many textbooks because they have made no significant progress on chemical evolution since 1953.

<https://www.youtube.com/watch?v=2G3Gbr0eem8> (2 min)

What did he do?

Isolated five of the simplest amino acids.

Used an ammonia, nitrogen, hydrogen, methane, carbon dioxide and water vapour gas mix which was never Earth's atmosphere and never could be. Any ammonia would rapidly dissolve in the seas, and the evidence shows that the earth's atmosphere always contained free oxygen, which would destroy his amino acids.

Had a cold trap to isolate his compounds as they were made.—The real world has no such protective traps.

His amino acids were a racemic (1 to 1) mix of left and right handed amino acids. But living organisms only work with purely left-handed amino acids. Right handed amino acids would corrupt any proteins they went into and would soon kill the organism.

Most of what Miller produced was tars which are highly toxic to life. It is now known that his work demonstrates that creating life

from simple chemicals is NOT possible.

An update on Miller's work:

<http://blogs.discovermagazine.com/notrocketscience/2011/03/21/scientists-finish-a-53-year-old-classic-experiment-on-the-origins-of-life/#.WvPas39x1EY>

*Some Other Resources Available at <https://chcpublications.net/>*

**Books of Moses: Fact or Fiction Series**

**Origin of the Universe and Our Earth**—How did Earth and our Universe Originate? Both the Biblical and Big Bang Models are presented. Evidence for and against the models is also presented.

**Origin of Life**—How did Life Originate on Earth? Both the Biblical Special Creation and Evolutionary Neo-Darwinian Models are presented. The Biblical Model covers the creation of plants and aquatic and flying organisms, while the Evolutionary model investigates the Origin of the First Cell. Evidence for and against the models is also presented.

**Mankind and Evolution of Life**—How did complex life, including humans, originate on Earth? Both the Biblical and Evolutionary Models are presented. The Biblical Model covers the creation of land animals and the first man and woman, while the Evolutionary model investigates what is required for their First Cell to evolve into complex organisms. Evidence for and against the models is presented.

**The Fall of Creation**—What is the Fall of Creation on Earth, and what was its Impact? The Biblical Account is presented, including sin, death and the banishing of Adam and Chavvah (Eve) from the Garden of Eden. Evidence for and against this account is presented.

**The Great Flood, Part 1**—Was there a Great Flood during Noah's life? The Biblical Account explains why there was a Great Flood, Noah's role in it and the extent of the Flood. This session ends with Noah and the animals leaving the Ark after the Flood.

**The Great Flood, Part 2**—What events followed the Great Flood during Noah's life? Where did the Ark land? It also looks at many of the objections to the Great Flood and shows evidence that it was a real event which shaped the world we live in.

**Shinar, Nimrod and the Tower of Babel**—What did mankind do after the Flood? Where is the Plain of Shinar and where was Nimrod's first Kingdom, including the location of the Tower of Babel? Why did God intervene and create a myriad of new Languages?

**The Exodus from Egypt**—Historical and Scientific information relating to the Israelites' Exodus from Egypt is presented, analysing several proposed pathways to Midian, including crossing the Soph (Red) Sea.

**To Mount Sinai and God's Instructions**—After crossing the Soph Sea, where did the Israelites go until their arrival at Mount Sinai, and where is this mountain? This article includes Jehovah God giving them His Instructions there. Historical and Geographical information is presented, some of it new and previously unpublished.

**The Holy Bible CHCoG Translation**—From the original Hebrew and Aramaic. It is accurate and readable, giving you a clear understanding of God's message.
